SATELLITE IMAGES

---

Version 1.0

Released: 13 October 2020

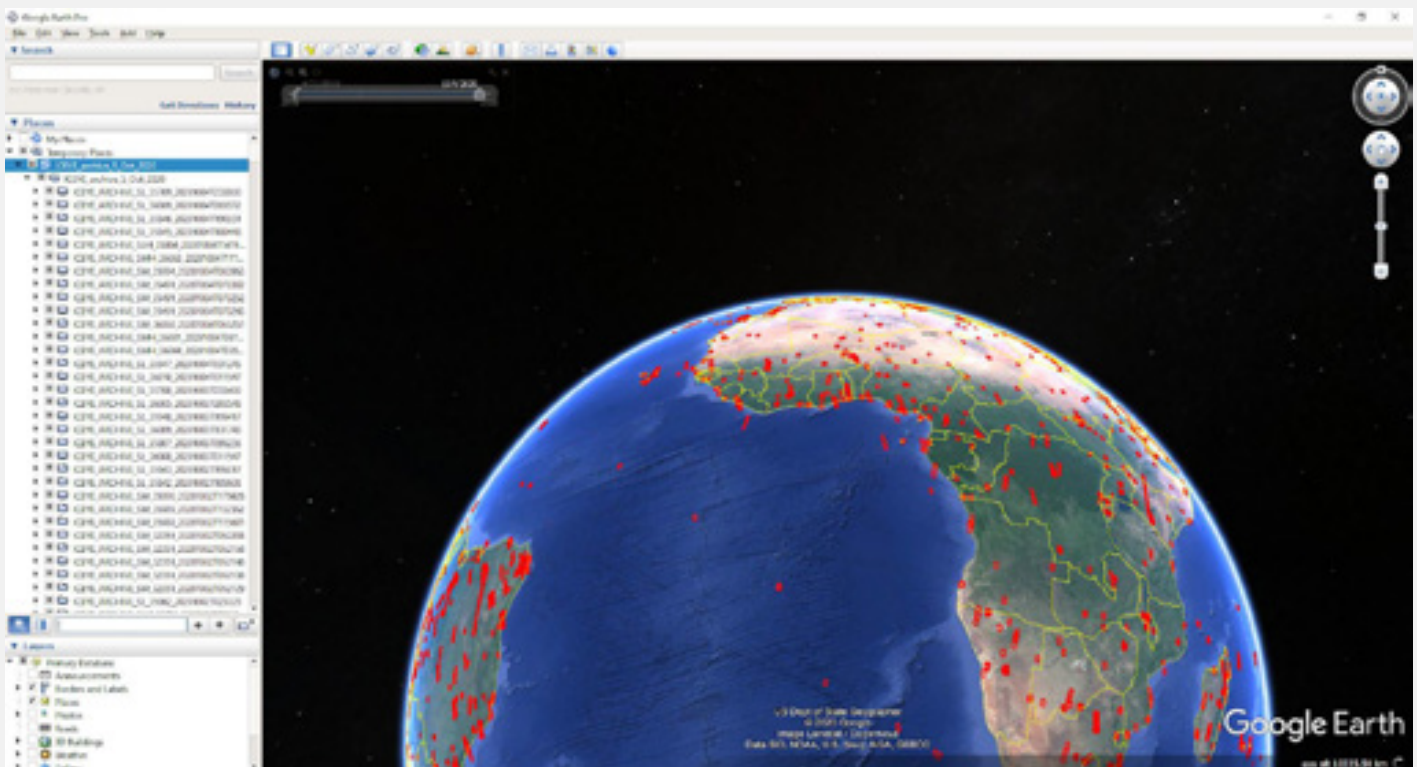

[www.ICEYE.com](http://www.ICEYE.com)

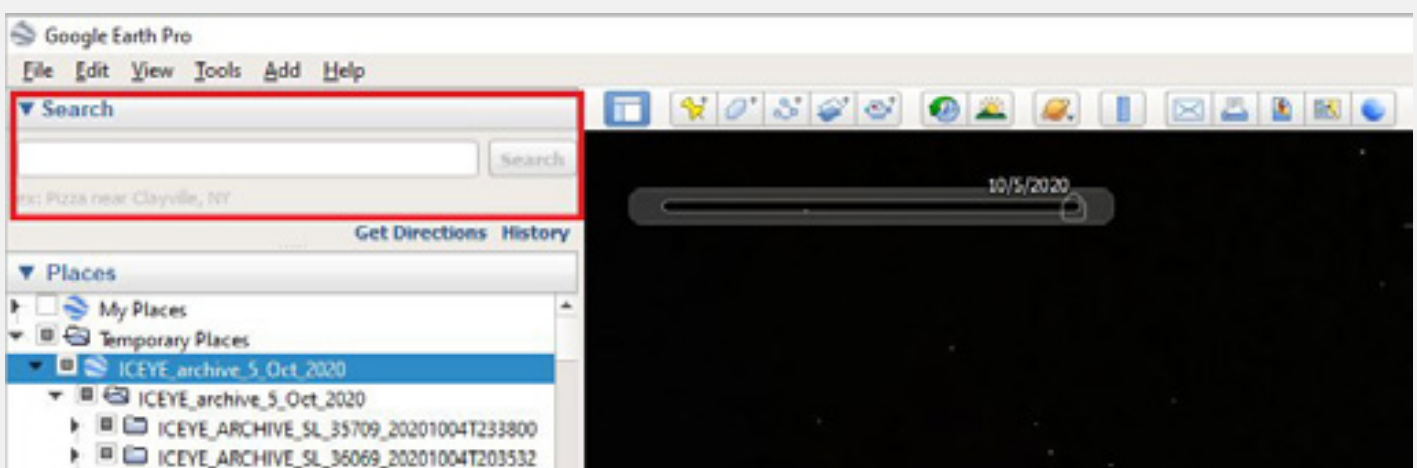

# ICEYE PUBLIC ARCHIVE

## HOW TO USE THE KMZ FILE

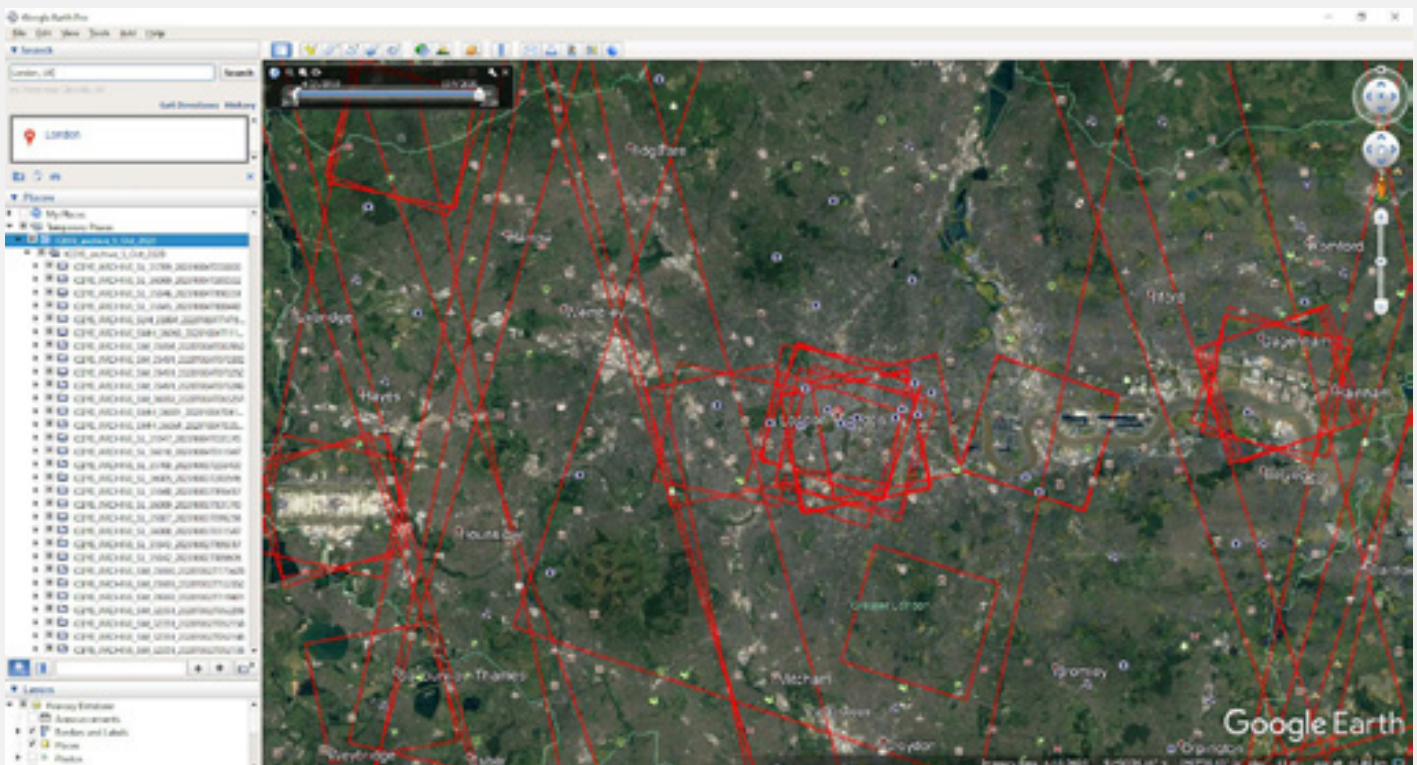

1. Download the KMZ file, open it with Google Earth Pro.  
You will see multiple image extents across the globe.

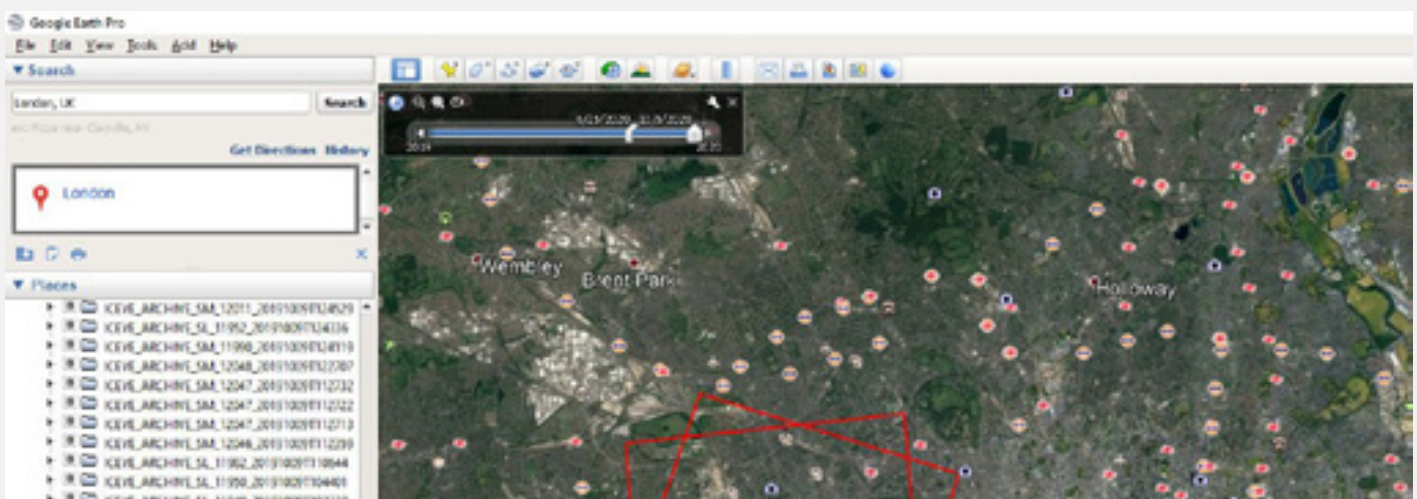

2. In the Search field on the upper left corner, you can search for your Area of Interest (enter name or coordinates) and press “Search”. The planet view will move and zoom in to the area.

3. You will likely see several image extents over your area of interest. ICEYE SAR satellite images are acquired in different modes with different image width and length. For example, Stripmap images have a greater length than Spotlight images.

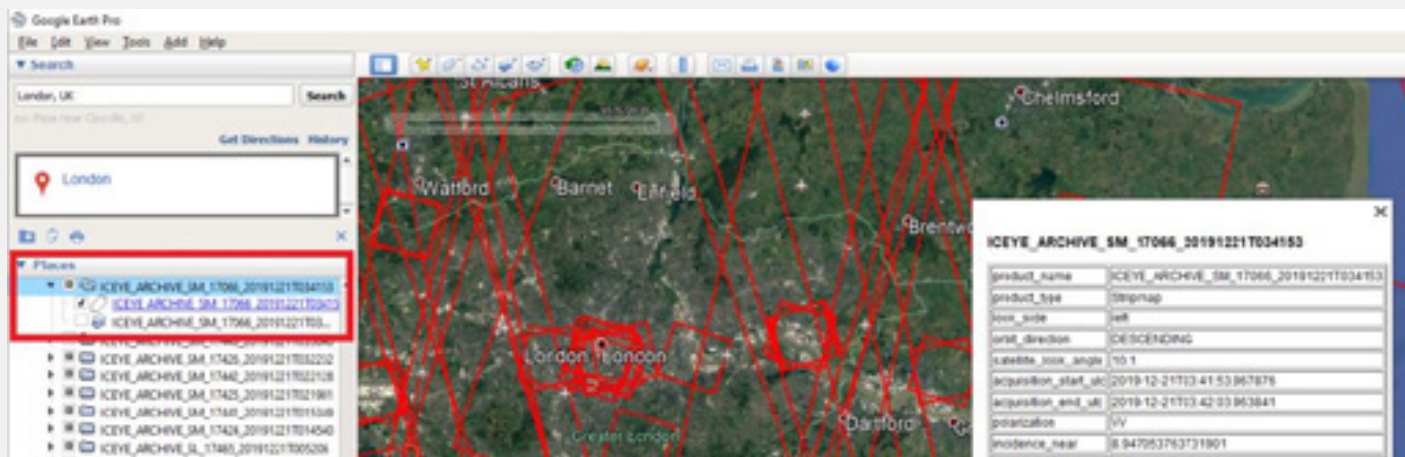

4. If you want to sort images by date of acquisition, use the timeline in the left top corner of the main window.

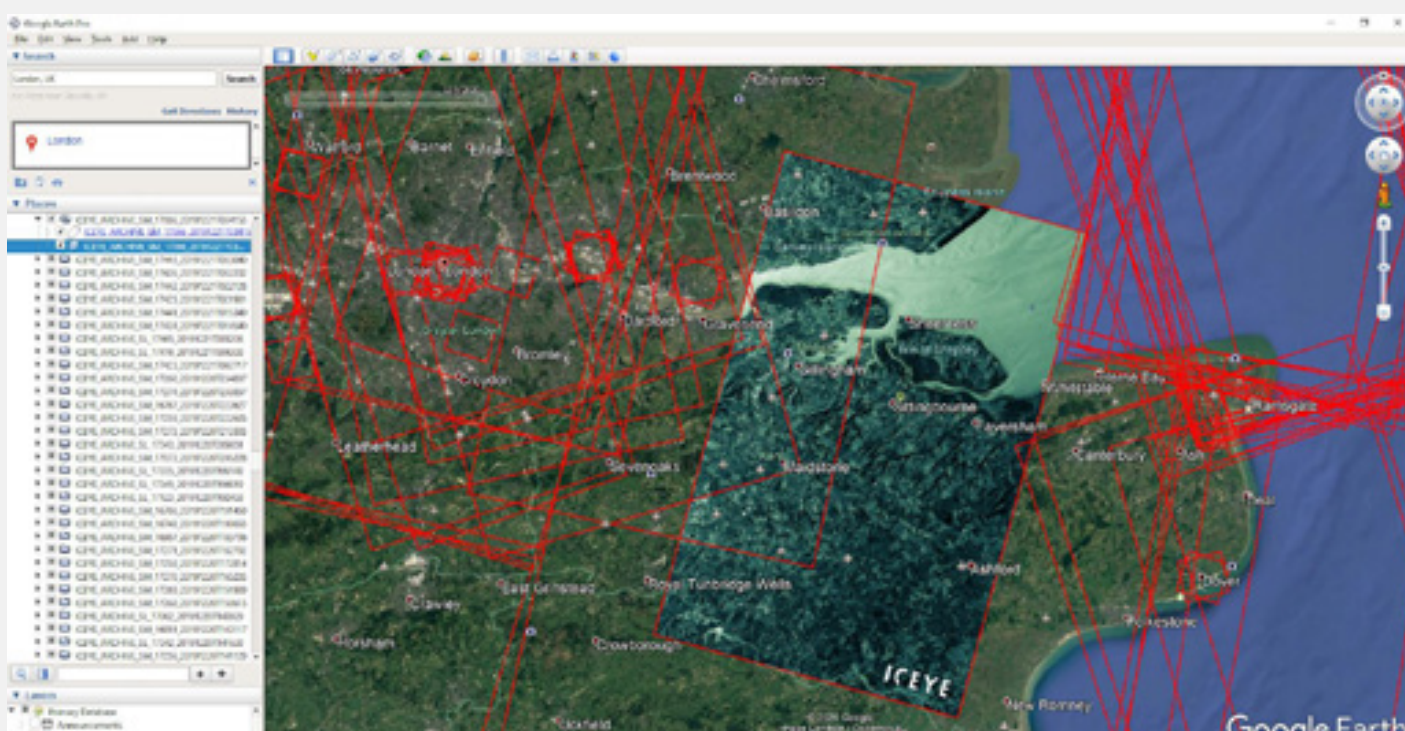

5. If you left-click on the extent, a pop-up window will be opened showing the image metadata which includes information about the image acquisition parameters.

6. To see the image thumbnail, use the "Places" panel on the left. Once you left-click an extent in the main window, the corresponding image folder is automatically selected in the "Place" panel. Click the arrow to open the subfolder contents and check the checkbox of the image overlay.

7. To see the image in the browser (PNG format), right-click the image overlay in the “Places” panel and choose “Properties”.

8. In the pop-up window, copy the link and paste it to your browser.
